Repeat Dose Toxicity: In repeated dose studies, the principle effects of xylenes were adaptive changes in the liver, body weight changes, organ weight changes and altered motor coordination. Available case reports, occupational studies, and studies on human volunteers suggest that both short- and long-term exposures result in a variety of adverse nervous system effects that include headache, mental confusion, narcosis, equilibrium, impaired short-term memory, dizziness and tremors. Reports have associated repeated and prolonged overexposure to petroleum distillates with adverse liver, kidney and bone marrow effects and with permanent brain and nervous system damage. Intentional misuse by deliberately concentrating and inhaling the product may be harmful or fatal. Stoddard solvent and VM&P Naphtha have been shown to cause kidney and liver damage in repeat dose animal studies.

Carcinogen Status: Ethylbenzene is listed by IARC as "Possibly Carcinogenic to Humans (Group 2B) and as a "Confirmed Animal Carcinogen with Unknown Relevance to Humans (A3) by ACGIH. NTP conducted a two year carcinogenicity study with Stoddard solvent in rats and mice. The studies indicated there was some evidence of carcinogenic activity in male rats but none in female rats. In mice there is equivocal evidence in female mice for carcinogenic activity but no evidence in male mice. IARC has classified petroleum solvents "not classifiable as to their carcinogenicity to humans. None of the other components are listed as carcinogens by IARC, NTP, ACGIH, OSHA or the CLP Regulation (EC) No 1272/2008.

Germ Cell Mutagenicity: Ethylbenzene was negative in the AMES test, chromosome aberration assay, sister chromatid exchange and in vivo micronucleus assay. It was positive in a mouse lymphoma assay. Available data from both in vitro and in vivo studies suggest that xylenes are not genotoxic. Stoddard solvent was negative in the AMES test, in a mouse lymphoma assay and in an in vivo bone marrow assay.

Toxicity for Reproduction: Ethylbenzene: In a developmental study, rats were exposed to 100 to 1000 ppm for 1-19 days after gestation. At 1000 ppm maternal toxicity and limited developmental toxicity was observed. NOEL (maternal and developmental) was considered to be 100 ppm. Xylene: Inhalation exposure of rats from gestation day 6-20 for 6hr/day produced maternal toxicity at 100 ppm and fetal toxicity effects at 500 ppm. NOEL for maternal toxicity was considered to be 500 ppm and developmental toxicity was 100 ppm.
